

Modules at a Glance:

Bleeding after Birth Complete (BABC)

An on-site training for healthcare providers working in clinical settings.

Bleeding after Birth Complete is a module designed to reduce maternal deaths caused by post-partum hemorrhage (PPH). The module builds capacity of the entire team of health workers who provide care for women and newborns at birth. With BABC, skills are built around communication and teamwork, active management of the third stage of labor, early detection and basic management of PPH, and advanced care skills. These skills include management of shock, uterine balloon tamponade, manual removal of the placenta, repair of cervical lacerations, and use of the non-pneumatic anti-shock garment. The materials include a Flipbook, Provider's Guide, and two Action Plans, as well as a folder of necessary supplemental materials that are critical components for success. BAB Complete is endorsed by ICM, FIGO, UNFPA, ICN, and AAP.

KEY COMPETENCIES COVERED

- Active management of third stage of labor, early detection and basic management of post-partum hemorrhage including non-pneumatic anti-shock garment.
- Advanced post-partum hemorrhage management skills in: management of shock, manual removal of placenta, uterine balloon tamponade, and cervical laceration repair.

DURATION/INTENDED AUDIENCE

- Day 1: Designed for all team members who interact with pregnant, laboring, and post-partum women at any level of the health system. This day covers prevention, detection, and basic management of PPH.
- Day 2: Designed specifically for skilled birth attendants to enhance their ability for ongoing management of post-partum hemorrhage. This day covers prevention and management of shock in addition to advanced care skills. Length of this day depends on inclusion of various skills. For example, cervical laceration repair may or may not be in the scope of the program being designed.
